- One job does everything. No fiddling around with supplemental tasks on data selection or summarisation
- Uses commitment control to ensure data integrity is always maintained
- Runs in Proof or Update modes
- Developed by Oracle Certified Partners and long time JD Edwards Consultancy

- SALES ORDER PROCESSING
- PURCHASE ORDER PROCESSING
- ACCOUNTS RECEIVABLE
- ACCOUNTS PAYABLE
- GENERAL LEDGER
- INVENTORY
- MANUFACTURING
- CUSTOM FILE PURGING

Purge-it! iSeries

Purge-it! iSeries for JD Edwards World and EnterpriseOne

Established since 2003 Purge-it! iSeries is installed and running at some of the largest users of JD Edwards in the World. Purge-it! is the only product on the market specifically developed for JD Edwards by a JD Edwards consultancy, it knows the necessary rules to be applied to transactions to see if they are eligible for purge and removes all related data. Purge-it! is more than a simple tool, it is a solution to your purging needs.

Purge-it! Modules

Currently Purge-it! iSeries is available in the following modules:

- Accounts Receivable
- Accounts Payable
- General Ledger
- Purchase Order Processing
- Sales Order Processing
- Manufacturing
- Inventory
- Custom / Bespoke File Purge

All Purge-it! modules are individually licensed. Therefore you only need to purchase the modules that you wish to install and run.

Each Purge-it! module can be run stand alone or in an integrated manner where related application areas can be purged simultaneously (for example: Accounts Receivable and General Ledger). The modules come pre-configured with standard template profiles to help users get started. Users can create their own profiles or just run the standard ones. Varying degrees of validation and data selection can be configured to alter the effectiveness of the purge.

Each Purge-it! module knows the purging rules and files for the application area being purged. Therefore no detailed technical understanding of JD Edwards is required to configure and use the software.

Purge-it! Sessions

Purging runs are organised into easy-to-manage 'sessions'. Purge-it! sessions contain a schedule that consists of one or more modules to be run. Every session can be analysed and audited on-line using intuitive session management applications. Session or purge run information will be reported back to the purge session and all results and audit information will be accessible from the Work with Session Runs screen. Purge-it! session information provides an invaluable history of all your purge and archive activities.

Purge-it! Audit Data

All Purge-it! runs produce audit data whether the purge is in proof or update mode. This audit data is extremely valuable when analysing the purge results and will help when refining the purge criteria. The power to analyse purge runs for data purged and also for data excluded from purging due to exception conditions is available through the Module Audit Options screen.

The Module Audit Options screen allows for the display of all purged transactions. This screen also allows for the display of all excluded transactions. Details of the excluded transaction can be viewed showing the reasons why the transaction could not be purged.

Audit data provides an invaluable history and audit trail of your purging activities and puts you firmly in control of your purging process.

Data Integrity

Purge-it! has been designed with the key concept of protecting data integrity. Fundamental decisions on protecting your data are built into the software whilst other less important validations are parameter driven. By taking these decisions out of the hands of the individual users the risk to your data through incorrectly run purges is dramatically reduced.

Purge-it! uses commitment control to protect related data, therefore no matter how a purge ends you will never have a situation of part purged or orphaned data.

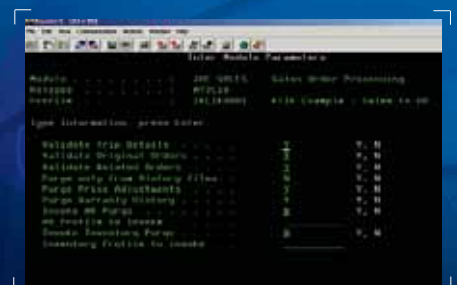

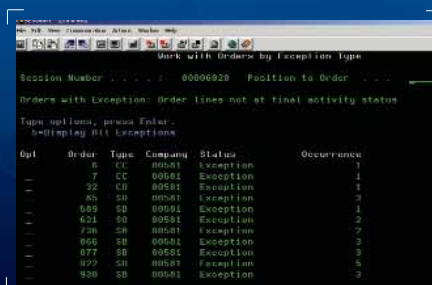

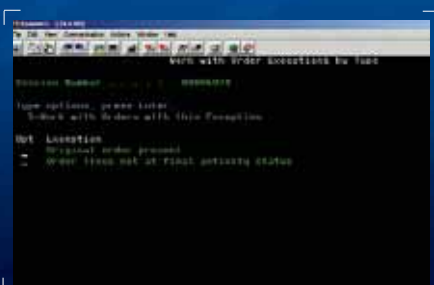

Running Purge Jobs

All Purge-it! jobs run as a single submitted batch job and can be run whilst users are still accessing the system. A job can consist of one or many modules which can be submitted through the Purge-it! software or via any other batch scheduling software.

Each Purge-it! job is self contained without the need to run any other processes or queries for data selection and work file builds. No post purge processes are required to perform any further data summarisation or tidying.

Purge-it! jobs can be stopped half way through without any affect on the integrity of your data. When ready to restart you simply re-submit the purge.

“organised into
easy-to-manage
sessions”

Key Facts

- Purge-it! uses commitment control to organise transactions into logical groups for update. This means that at no time will you get partly purged data and orphaned records as a result of an incomplete purge
- Purges can be run in Proof or Update modes
- Full on-line help is available, both Purge-it! and JD Edwards specific
- Purge runs can be stopped and restarted under the users control with no effect on the purge results
- The purge process can be run during the online day whilst users access the system
- Retained database integrity is built into the system giving maximum protection. Some options are override-able but fundamental decisions on integrity are not
- No technical knowledge of the JD Edwards database and table relationships is required to use Purge-it!

“the UK’s leading
developer/supplier of purging
software for JD Edwards”

About Klik IT

Since 1998, Klik IT has provided consultancy, development, and support services to users of JD Edwards. Based in the UK but with clients worldwide, Klik IT strives to provide the highest level of quality in all its products and services. By working hand in hand with our clients we have accumulated an enviable level of knowledge and expertise and our clients include some of the largest users of JD Edwards in the world.

Purging Specialists

Klik are an established Oracle Certified Partner. Our partnership specifically targets our complimentary JD Edwards toolsets of which Purge-it! is one. We are the leading developer/supplier of purging software for JD Edwards in the UK and since developing the Purge-it! software solution have implemented it in many companies both in the UK and overseas.

Purging Services

If you need to purge but feel that you do not have the in-house expertise or time to run a purging project then Klik IT’s Purging Services might be the solution for you. No outright product purchase is required if you choose to take this service. Please see our related leaflet on ‘Klik IT Purging Services’ for further information.
